The selected image for this project I will go with, is my first and only car and when I first got it, in a parking lot parked next to my friends' vehicle. The image has my white crown victoria parked next to his Infiniti G35 and there is a small garden with shrubbery and grass as well as a tree. In the background of the image is other parked card, light poles, trees, and houses in the distance with a hedge as a wall. Both of our vehicles would be boxes that would be transformed into elongated rectangles with a total of four torus wheels on both vehicles. The background would be boxes for the houses, cylinders for light poles, the trees would be many cylinders stacked on top of each other and then for the leaves either cones or prisms and pyramids would be used to help form them. For the planters, medians, or tree islands, would be an torus transformed into an elongated sphere with room in the center for miniature prisms and boxes for the shrubbery. The hedge in the background would separate the houses and would simply be a box with a grassy texture and the bottom of the light poles would be a tapered cylinder.

The items I would recreate in 3D would be both my vehicle and my friends vehicle which would be two different distinct objects, the tree, and if there is enough time light poles and the hedge which would separate the background from the foreground and then I would place the picture of the houses in the background. The light poles are also two cylinders, one is tapered and a bit stubbier and wider, while the pole is elongated and then at the top curves and allows for housing of light on two ends in cylindrical housings. While simple it may be easy to recreate the houses as well, getting proper curvature for both vehicles and proper connection for the torus which will become wheels will be very tough. The plane will be darkened to mimic that of a blacktop or the parking lot, and as mentioned both vehicles will start off as boxes that will become elongated, sitting on top of four torus. The tree will be a cone for a start and multiple cones will conjoin to mimic that of the tree. The angle that will be selected is going to be a wide headshot of both vehicles with the light Pole on the right side, the tree on the left side and both vehicles centered.
